Sequence 532, Application US/09263959
Patent No. US20020150891A1
GENERAL INFORMATION:
APPLICANT: Rowen, Lee
APPLICANT: Rowen, Lee
TITLE OF INVENTION: DIAGNOSTIC AND THERAPEUTIC COMPOSITIONS AND METHODS WHICH UTI
CORRESCONDENCE ADDRESS:
ADDRESSEE: Seed and Berry LLP
STREET: 6300 Columbia Center, 701 Fifth Avenue
                                                                                                                                                                APPLICANT: Hood, Leroy E.
APPLICANT: Rowen, Lee
APPLICANT: ROWEN, Lee
APPLICANT: ROSOP, Ben P.

Sequence 15, Application US/09953562
Publication No. US20030096241A1
GENERAL INFORMATION:
APPLICANT: ZERIA PHARACEUTICALS CO., LTD.
TITLE OF INVENTION: METHOD OF SCREENING A DRUG FOR TREATMENT OF SQUAMOUS
TITLE OF INVENTION: CELL CARCINOMA
FILE REPERRACE: B6114-01
CURRENT APPLICATION NUMBER: US/09/953,562
CURRENT APPLICATION NUMBER: US 2001-083352
PRIOR APPLICATION NUMBER: US 2001-08352
PRIOR FILING DATE: 2001-03-22
SEQ ID NOS: 27
SEQ ID NO 15
LENGTH: 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 19;

Sequence 1. Application US/10362010

Publication No. US20040038247A1

GENERAL INFORMATION:
APPLICANT: Branner, Sidney
APPLICANT: Tan, Yin, Hwee
TITLE OF INVENTION: AND PHARMACEUTICAL COMPOSITIONS AND METHODS UTILIZING SAME FOR TITLE OF INVENTION: AND PHARMACEUTICAL COMPOSITIONS AND METHODS UTILIZING SAME FOR TITLE OF INVENTION: REGULATING T-CELL MEDIATED IMMUNE RESPONSE
FILE REFERENCE: 01/22004
CURRENT APPLICATION NUMBER: US/10/362,010
CURRENT FILING DATE: 2003-08-19
NUMBER OF SEQ 1D NOS: 27

SOFTWARE: PATENTINE VERSION 3.2

```
which contain single nucleotide polymorphisms (SNPs). Sequences 1 to 1112 which contain single nucleotide polymorphisms (SNPs). Sequences 1 to 1112 (AAA74219) are consecutive pairs of nucleotides which contain callent SNPs. Sequences 1113 to 1122 (AAA7430-AA7509) are consecutive pairs of nucleotides containing SNPs which result in changes in the corresponding amino acid sequences (AAA7430-AA7509) are consecutive casquences 1113 to 1128 (AAA7445) lead to conservative amino acid sequences 1113 to 1128 (AAA7745) lead to conservative amino acid sequences 1113 to 1128 (AAA77430-A77509) are 1192 changes, while those in Sequences 1129 to 1186 (AAA7746-A77503) result in on- conservative changes. The SNPs in sequences 1187 to 1192 changes to a method of detecting a polymorphic site in a nucleic acid and a method of detecting polymorphic sites, antibodies raised against such peptides containing polymorphic sites, antibodies raised against such peptides containing polymorphic sites, antibodies raised against such peptides containing polymorphic sites, antibodies raised cagainst such peptides und a method of detecting polymorphic cagainst such peptides und antibodies. The nucleic acids are useful for gene therappy of an individual having, suspected of having, or at risk of developing a pathological condition due to the presence of a sequence colymorphism. Such treatment would comprise administration of the wild-
      Human nucleic acids containing single nucleotide polymorphisms, useful for treating a subject suffering, or at risk from a pathology due to the presence of a sequence polymorphism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Response element; Z-DNA; neoplasia; hexokinase II; glycolysis; cancer;

hexokinase promoter region. Response elements (transcription factor binding site) in this fragment may consist of all or part of the present chinding site) in this fragment may consist of all or part of the present caequence. AS-30D is a new isolated hexokinase II. The present DNA cragment is capable of regulating transcription of a downstream open creading frame and contains at least one response element. The present DNA cragment may be coupled to a reporter gene and used to screen for it alternatively it may be coupled to a toxic gene and used to treat or it hat over-express hexokinase II, such as those present in patients with cancer. It may also be used in gene therapy to treat diabetes. The With cancer it may also be used in gene therapy to treat diabetes. The the concerning an element are used in the method the caigmosting a neoplasia that over-expresses hexokinase. The new for diagnosing a neoplasia that over-expresses hexokinase. The new concepts are active only in tumours, not in normal cells
                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific
     present sequence represents a segment of the hepatoma AS-30D Type II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.

having the sequence (GC-dA)n (GG-dT)n which can be used as genetic markers. Primers based on these sequences can be used as genetic repeats. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. Those clones where the repeat sequence has been determined are shown in AATGS704-797. This repeat sequence is from the marker clone Mdf15 which contains the repeat sequence is from the marker clone Mdf15 which contains the repeat sequence is from
phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-777. This repeat sequence is from the marker clone Mdf46 which contains the repeat sequence having the formula: (AC)25. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymorase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromsome; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to the isolation of polymorphic repeat sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detection of polymorphic genetic markers of the form (dC-dA) n (dG-dT) n using novel nucleic acid mols. as primers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention provides a novel method for isolation of satellite sequences from genomic DNA that comprises fragmentation of the DNA by a method which is not dependent on base sequences, then selection of the satellite sequences from the obtained genomic library of high homogeneity. The method is useful for the isolation of microsatellite DNA sequences which can be used as DNA markers. The new method markedly improves the efficiency of isolation of satellite sequences in comparison to prior art methods which are reliant on base sequences. Sequences AAZ99483-514 represent sequences from Haliotis discus, used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  of satellite sequences from genomic DNA for use as DNA markers isolating a library with high homogeneity by DNA fragmentation.

The invention provides a novel method for isolation of satellite sequences from ganomic DNA that comprises fragmentation of the DNA by a method which is not dependent on base sequences, then selection of the satellite sequences from the obtained genomic library of high homogeneity. The method is useful for the isolation of microsatellite DNA sequences which can be used as DNA markers. The new method markedly improves the efficiency of isolation of satellite sequences in comparison to prior art methods which are reliant on base sequences. Sequences AA298483-514 represent sequences from Haliotis discus, used in the method of the invention
                                                                                                                                                                                                                                                                     Isolation of satellite sequences from genomic DNA for use as DNA markers comprises isolating a library with high homogeneity by DNA fragmentation.

ö The specification describes a composition for assaying conformational change of a capsid protein. The composition comprises a Human farmunodesficiency virus (HIV) capsid protein which has a modification, and comprises a cavity of about 600 Angstrom cubed. The composition is useful for screening molecules that inhibit capsid carboxy terminal domain dimerisation. The composition is also useful in in vitro maturation assays, for inhibiting capsid maturation, in in vitro assembly assay, to assembly assay, to assembly to inhibit to maturation of the capsid protein. The present sequence represents an oligonucleotide used to test the inhibition of cylindrical formation of capsid proteins by compounds of the Detecting a nucleotide repeat region in a nucleic acid having a particular length, useful for identifying nucleotide length polymorphism associated with a neurodegenerative disease, comprises using a ligase-Microsatellite, ligase-assisted spacer addition assay; LASA; cancer; nucleotide length polymorphism detection; neurodegenerative disease; fragile X syndrome; Huntington's disease; muscular dystrophy; forensic; gene mapping; population study; human; primer; ss. of capsid proteins, sing a 600 cubic angstrom Gaps 2316 rerererererererecererererererererececerere 2365 ö The invention relates to a method of identifying or detecting M. CC nucleotide repeat region in a nucleic acid molecule characterised by a particular length, comprising employing ligase-assisted spacer addition (CC (LASA) assaay. The method is useful in the identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a particular length. In particular, the method is useful for identification of a nucleotide length polymorphism in animals or humans, which is associated with a neurodegenerative disease including fragile X syndrome, thurtington's disease, or muscular dystrophy. Furthermore, the method may be used for identifing and/or typing microorganisms including yeasts and lower uni- and multi-cellular organisms, as well as prokaryotic microorganisms; and for genotyping subjects including humans. The method can be used to provide markers for use in microorganisms, to ascertain cancers and other malignancies. Moreover, the method can be used to provide markers for use in dentification of human and non-human individuals, plants and microorganisms, to ascertain parentage of human or non-human individual, dentification of human and non-human individuals, plants and conditor responses to therapies including the possibility of microorganisms, to ascertain parentage of human or non-human individual, condition responses to therapies including the possibility of crime, in gene mapping and population studies. LASA may also be used in the manufacture of a kit for detecting and/or identifying nucleotide crime. In gene mapping and population studies. LASA method such as a nucleotide length polymorphism in a enkaryotic genome. The LASA method avoids the time and cost required by prior art methods using gel electrophoresis and southern transfer analysis. In midting step, making it a strong candidate for future use in clinical and laboratory procedures. ABK24276-ABK24313 represent primes used to human in detection or human in the method of the human or microsatellites as described in the metericular.

which contain single nucleotide polymorphisms (SNPS). Sequences 1 to 1112

(AAA76318-A77429) are consecutive pairs of nucleotides which contain

CC (AAA76318-A77429) are consecutive pairs of nucleotides which contain

CC sequences 1131 to 1128 (AAA77430-A77489) are consecutive

CC corresponding amino acid sequences (AAB11749-B11828). The SNPs in

CC changes, while those in sequences (AAB11749-B11828). The SNPs in

CC changes, while those in sequences 1129 to 1186 (AAA77440-A77503) result

CC in non-conservative changes. The SNPs in sequences 1187 to 1192

CC (AAA77504-A77509) generate frameshift mutations. The invention also

CC relates to a method of detecting a polymorphic site in a nucleic acid and

CC amethod of determining the relatenses of two nucleic acids. It also

CC compasses peptides containing polymorphic sites, antibodies raised

CC against such peptides, and a method of detecting polymorphic

CC against such peptides using the antibodies. The nucleic acids are useful for

CC gene therapy of an individual having, suspected of having, or at risk of

CC developing a pathological condition due to the presence of a sequence

CC polymorphism. Such treatment would comprise administration of the wild-

Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T6647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone MdIIO9 which contains the repeat sequence is from formula; GGGAAATAGG(CA)18. (Updated on 25-MAR-2003 to correct PF field.) Sequences AAA76318-A77509 represent 1192 human nucleic acid sequences which contain single nucleotide polymorphisms (SNRs). Sequences 1 to 1112 AAA76318-A77429) are consecutive pairs of nucleotides which contain silent SNRs. Sequences 1113 to 1192 (AAA7430-A77509) are consecutive pairs of nucleotides containing SNPs which result in changes in the sequences 1113 to 128 (AAA77449-B1828). The SNPs in sequences 1113 to 1128 (AAA77445) lead to conservative amino acid sequences 1129 to 1186 (AAA77446-A77503) result in non- conservative changes. The SNPs in sequences 1187 to 1192 (AAA77509-A77509) generate frameshift mutations. The invention also relates to a method of detecting a polymorphic site in a nucleic acid and a method of determining the relatedness of two nucleic acides. It also ö Human nucleic acids containing single nucleotide polymorphisms, useful for treating a subject suffering, or at risk from a pathology due to the presence of a sequence polymorphism. genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf69 which contains the repeat sequence is from formula: (AC)18.5A(AC)3. (Updated on 25-MAR-2003 to correct PF field.) The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone Mdf1 which contains the repeat sequence having the marker clone Mdf1 which contains the repeat sequence having the cormula: CATA(CA)19. (Updated on 25-MAR-2003 to correct PF field.)
              against such peptides, and a method of detecting polymorphic proteins/peptides using the antibodies. The nucleic acids are useful for gene therapy of an individual having, suspected of having, or at risk of developing a pathological condition due to the presence of a sequence bolymorphism. Such treatment would comprise administration of the wild-type nucleic acid sequence. Antibodies raised against polymorphic peptides can also be used in the treatment of such individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus;

The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine Mbol DNA fragments of between 250 and 500
constant an (AF)15 and an (TC)15 oligonucleotide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
clones cross-hybridised. Assuming independent distribution of
constant and Mbol sites, the frequency of (TG)n >9 microsatellites
constant and one persone is estimated at >100, 000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequence usetrate and
constream of the microsatellite sequence were used to generate the
required PCR primers for in vitro amplification of the corresp.
controsatellite (using the program OPTIPRIM). The microsatellites may be
microsatellite (using the program OPTIPRIM). The microsatellites may be
conomically important trait loci, or genes involved the determinism of
economically important traits esp. in cattle, to allow selective
conomically see also AAQ33501-34437. (Updated on 25-WAR-2001 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used to detect these markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis of Genetic disease, commercial enepast sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clomes were amplified by primers Arte7394-R6647. Those clomes where the repeat sequence has been determined are shown in AAAT65704-797. This repeat sequence is from the marker clone Mdf11 which contains the repeat sequence is formula: (AC)23A. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis of containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AHG5799-T66047. Those clones where the repeat sequence has been determined are shown in AATG5704-797. This repeat sequence is from the marker clone Md14 which contents the repeat sequence is from the marker clone Md14 which contents the repeat sequence is from the marker clone Md14 which contents the repeat sequence is from the marker clone which contents the repeat sequence is from the marker clone which contents the repeat sequence having the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                              The invention relates to the isolation of polymorphic repeat sequences having the sequence (dG-dA)n (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly (dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AT6579-766047. Those clones where the repeat sequence has been determined are shown in AAT65704-799. This repeat sequence is from the marker clone Mdf59 which contains the repeat sequence is from the marker clone Mdf59 which contains the repeat

The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, vbetaRNA or cDNA. The kit is useful for diagnosing organ transplant respection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, infectious diseases arophic gastritis. Degenerative nervous system diseases include multiple arrophic gastritis. Degenerative nervous system diseases include multiple arrophic gastritis begenerative nervous system diseases include multiple arrophic gastritis begenerative nervous system diseases include multiple arrophic gastritis. Degenerative nervous system diseases include multiple of allergies. Type II hypersensitivities such as those present in allergies, Type II hypersensitivities such as those present in coodpasture's syndrome and Type IV hypersensitivities such as those caused by the yeast genus Candida, parasitic infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by Mycobacterium. Neoplastic diseases include as those caused by Mycobacterium. Neoplastic diseases include as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.

                                                                                                                                                                                       The sequence is a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (TG)n >9 microsatellites in the bovine genome is settinated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for general extentions and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. The repeats, when
                                                                                                The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybrid sation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers ANT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the contains the repeat sequence is from the contains the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

such as pig selected for having desired genotypic or potential phenotypic properties; (4) a transgenic animal comprising N1 or N2; and (5) sperm or an embryo derived from the animal of (3) or (4). N1 or its fragment is useful for selecting an animal estimed for slaughter or a breeding animal having desired genotypic or potential phenotypic properties. The properties are related to muscle mass and/or fat deposition. The sperm or an embryo are useful in breeding animals destined for slaughter. The

present sequence represents a microsatellite oligonucleotide, which is given in an example from the present invention for the identification of DNA sequence polymorphisms in the IGF2 (insulin-like growth factor 2) and

analysed, fall into 4 categories: 1) perfect repeats which are alternating tandem CA repeats with no interruptions and without adjacent repeats of another sequence; 2) imperfect repeats which are defined as 2 or more runs of uninterrupted CA repeats separated by no more than 3 consecutive non-repeat bases; 3) compound perfect repeats which are uninterrupted runs of CA separated by no more than 3 consecutive non-repeat bases from a run of at least 5 uninterrupted dinucleotide or longer repeats of a sequence other than (dG-dA)n. (dG-dT)n, or from at least 10 uninterrupted monomucleotides; and 4) imperfect compound repeats which are defined as for the perfect compound repeats except that the runs of CA are interrupted. The sequence presented here is an example of a perfect repeat sequence of structure: (AC)19. (Updated on 25-MAR-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Porcine; pig; wild boar; quantitative trait locus; QTL; chromosome 2; mapping; 2p1.7; select breeding; genotype; phenotype; muscle mass; fat deposition; IGF2; insulin-like growth factor 2; microsatellite; ds.

The invention relates to a method of identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a particular length, comprising employing ligase-assisted spacer addition [LASA] assay. The method is useful in the identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a particular length. In particular, the method is useful for identification of a nucleotide length polymorphism in animals or humans, which is associated with a neurodegenerative disease including fragile X syndrome, thuntington's disease, or muscular dystrophy. Purthermore, the method may be used for identifying and/or typhng microorganisms including yeasts and lower uni- and multi-cellular organisms, as well as prokaryotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detecting a nucleotide repeat region in a nucleic acid having a particular length, useful for identifying nucleotide length polymorphism associated with a neurodegenerative disease, comprises using a ligase-

The present invention describes a method (M1) for selecting a domestic animal for having desired genotypic properties. The method comprises testing the animal for the presence of a parentally imprinted quantitative trait locus (CTL). The pig QTL is located at chromosome 2, mapping at around position 2pl.7. Also described are: (1) an isolated and/or recombinant nucleic acid (N1) comprising a parentally imprinted QTL or its functional fragment, (2) an isolated and/or recombinant nucleic acid (N2) comprising a synthetic parentally imprinted QTL derive from at least one chromosome or its functional fragment; (3) an animal

Selecting a domestic animal for having desired genotypic properties comprises testing the animal for the presence of a parentally imprinted quantitative trait locus which is related to muscle mass and/or fat

microorganisms; and for genotyping subjects including humans. The method is also useful for detecting certain cancers and other malignancies.

C is also useful for detecting certain cancers and other malignancies.

C identification of human and non-human individuals, plants and individuals, plants and complication of human and non-human individuals, plants and to monitor responses to therapies including the possibility of and to monitor responses to therapies including the possibility of conclaic acid damage. The nucleotide polymorphisms may be used in forensic crime, in gene mapping and population studies. LASA may also be used in crime, in gene mapping and population studies. LASA may also be used in crepast regions such as a nucleotide length polymorphism in a eukaryotic genome. The LASA method avoids the time and cost required by prior art comparticular, current diagnosis of fluntington's disease relies heavily upon the use of gel electrophoresis and Southern transfer analysis. In particular, current diagnosis of fluntington's disease relies heavily upon the use of gel electrophoresis, a process that has proved difficult to the use of gel electrophoresis, a process that has proved difficult to the unintaurise. The LASA method allows total avoidance of this and laboratory procedures. ABK24276-ABK24313 represent primers used to detect polymorphisms or microsatellites as described in the method of the

The sequence is that of a bovine microsatellite sequence obtd. by

screening a library of bovine Mbol DNA fragments of between 250 and 500

creening a library of bovine Mbol DNA fragments of between 250 and 500

clones cross-hybridised. Assuming independent distribution of

clones cross-hybridised. Assuming independent distribution of

microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites

in the bovine genome is estimated at >100,000. The sequence information

con 230 such bovine microsatellites is summarised in the

specification and indexed herein (see below). The sequences upstream and

specification and indexed herein (see below). The sequences upstream

constructed PCR primers for in vitro amplification of the corresp.

required PCR primers for in vitro amplification of the corresp.

microsatellite (using the program OPTIPRIM). The microsatellites may be

microsatellite (using the program OPTIPRIM). The microsatellites may be

microsatellite individuals, for parantage testing, and in the genetic

sapping of economic trait loci, or genes involved the determinism of

connect pN approximat traits esp. in cattle, to allow selective

the connection of the correct PN action of the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits sp. in cattle, to allow selective by the determinism of the content of the content

field.)

```
The sequence is that of a bovine microsatellite sequence obtd. by

creening a library of bovine Mbol DNA fragments of between 250 and 500

CC bp with an (AC)15 and a (TC)15 oligonuclectide probe. One out of 50

CC clones cross-hybridised. Assuming independent distribution of

microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites

cn in the bovine genome is estimated at >100, 000. The sequence information

CC for ca. 230 such bovine microsatellites is summarised in the

cspecification and indexed herein (see below). The sequences upstream and

constrained PCR primers for in vitro amplification of the corresp.

crequired PCR primers for in vitro amplification of the corresp.

cused to identify individuals, for parentage testing, and in the genetic

cused to identify individuals, for genes involved the determinism of

cenomonically important traits esp. in cattle, to allow selective

checking. See also AAQ33501-34437. (Updated on 25-WAR-2003 to correct PN

field.)

```
The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Glones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Md£29 which contains the repeat sequence is from the marker clone Md£29 which contains the repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n-using novel nucleic acid mols. as primers.

The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers consociated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, consociated by the specifically priming and allowing amplification of acat Vbeta gene, consociated diseases and diseases and diseases and diseases including autoimmune diseases, degenerative nervous system diseases, infectious diseases and neoplastic diseases. Autoimmune diseases include Addison's diseases are propried astritis. Degenerative nervous system diseases include multiple atrophic gastritis. Degenerative nervous system diseases include multiple controphic gastritis and percentivities such as those contact with allergens that lead to allergies, Type II Mypersensitivities such as those contact contact with allergens that lead to consisted in leprosy. Infections diseases include viral infections caused by viruses such as HUV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases contact between and bacterial infections such as those caused by hopeastic filtaria and bacterial infections such as those caused by hycobacterium. Neoplastic diseases include lymphoproliferative diseases include as those caused by breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a Vbeta gene.
                                                                                                 Addison's disease, atrophic gastritis;

```
The sequence is that of a bovine microsatellite sequence obtd. by

CC screening a library of bovine MboI DNA fragments of between 250 and 500

CC bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50

CC olones cross-hybridised. Assuming independent distribution of for an icrosatellites and MboI sites, the frequency of (T6)n >9 microsatellites

CC domicrosatellites and mboI sites, the frequency of (T6)n >9 microsatellites

CC ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequence upstream and specification and indexed herein (see below). The sequences upstream and commistream of the microsatellite sequence were used to generate the commistream of the microsatellite sequence were used to generate the microsatellite (using the program OPITREM). The microsatellites may be microsatellite (using the program OPITREM). The microsatellites may be consected to identify individuals, for parentage testing, and in the genetic mapping of economically important traits esp. in cattle, to allow selective

CC breeding. See also AAQ33501-34437. (Updated on 25-WAR-2003 to correct PN first)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the isolation of polymorphic repeat sequences

having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
markers bramers based on these sequences can be used to detect these

repeats, especially for use in e.g paternity or maternity testing, human

genetic analysis such as linkage analysis of genetic disease, commercial
analysed, fall into 4 categories: 1) perfect repeats which are
alternating tandem CA repeats with no interruptions and without adjacent

crepeats of another sequence; 2) imperfect repeats which are

consecutive non-repeat bases; 3) compound perfect repeats which are

consecutive non-repeat bases; 3) compound perfect repeats which are

consecutive non-repeat bases; 3) compound perfect repeats which are

consecutive non-repeat bases; 5 innerrupted dinuclective on-

repeat bases from a run of at least 5 uninterrupted dinuclection

crepeat bases from a run of at least 5 uninterrupted dinuclection

crepeat bases from a run of at least 5 uninterrupted dinuclection

crepeats of a sequence other than (dC-dA)n. (dG-dT)n, or from at

least 10 uninterrupted mononuclectides; and 4) imperfect compound repeats

which are defined as for the perfect compound repeats

cross a perfect repeat sequence of structure: (CA)20. (Updated on 25-MAR-2003)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dc-dA). (dg-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf23 which contains the repeat sequence is from formula: (AC)20. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polymorphism, repeat sequence, genetic marker, primer, amplification, PCR; polymerase chain reaction, paternity, maternity, human, pedigree, linkage analysis, genetic disease, animal, plant, breeding, locus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detection of polymorphic genetic markers of the form (dC-dA) n(dG\text{-}dT)\,n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ઠે
                                                                                                                                                       The invention relates to the isolation of polymorphic repeat sequences

Ca having the sequence (dc-dA)n. (dg-dT)n which can be used as genetic

markers. Primers based on these sequences can be used to detect these

crepeats, especially for use in e.g paternity or maternity testing, human

crepeats, especially for use in e.g paternity or maternity testing, human

contained or plant breeding or pedigree analysis of genetic disease, commercial

analysed, fall into 4 categories: 1) perfect repeats which are

alternating tandem CA repeats analysis of genetic disease, commercial

alternating tandem CA repeats separated by no more drian 3

cor more runs of uninterrupted CA repeats separated by no more than 3

consecutive non-repeat bases; 3) imperfect repeats which are

consecutive non-repeat bases; 4) compound perfect repeats which are

consecutive non-repeat bases; 5) compound perfect repeats which are

consecutive non-repeat bases; 5) minimerrupted dinucleotide or

consecutive on a run of at least 5 uninterrupted dinucleotide or

conger repeat bases from a run of at least 5 uninterrupted dinucleotide or

conger repeats of a sequence other than (dc-dA)n. (dd-dT)n, or from at

consecutive non-repeat sequence congound repeats except that the

consecutive non-repeated monouncleotides; and 4) imperfect compound repeats

consecutive non-repeat sequence of structure; (AC)20. (Updated on 25-MAR-2003

The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated nucleotide core elements core repeat (SSR), having 2 or more tandemly repeated nucleotide core elements core includes in length. Also included are a nucleic acid primer a uitable for amplifying an SSR, identifying (M1) an SSR by preparing a core include for amplifying an SSR, identifying SSRs by prepared by the M1, selecting for referred genomic DNA enriched for SSRs and the gene are associated with the gene such that the SSR and the gene are speciated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a preferentially co-inherited, and selecting for the SSR in the breeding, and thod for DNA profiling grass or cereal species varieties by assessing variation between SSR varieties and testing the purity of grass or cereal ceed batches by assessing variation within seed batch of an SSR. The SSRs or profiling grass or cereal breeding, for may be used in the selection of genes in grass or cereal breeding, for may be used in the selection of genes in grass or cereal breeding, for profiling grass or cereal seed batches, and for DNA profiling to establish the creating the purity of grass or cereal seed as profiles, and for DNA profiling to establish the sequence is a ryegrass or fescue SSR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                             New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Microsatellite, ligase-assisted spacer addition assay; LASA, cancer, nucleotide length polymorphism detection; neurodegenerative disease; fragile X syndrome; Huntington's disease; muscular dystrophy; forensic; gene mapping; population study; human; primer; ss.

The invention relates to a method of identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a particular length, comprising employing ligase-assisted spacer addition (LASA) assay. The method is useful in the identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a particular length. In particular, the method is useful for identification of a nucleotide length polymorphism in animals or humans, which is associated with a neurodegenerative disease including fragile X syndrome, the funtington's disease, or muscular dystrosphy. Purthermore, the method may be used for identification of purpose or muscular dystrosphy. Purthermore, the method may be used for identifying and/or typing microorganisms including yeasts and clower uni- and multi-cellular organisms, as well as prokaryotic is also useful for detecting certain cancers and other malignancies. Moreover, the method can be used to provide markers for use in dentification of human and non-human individuals, plants and confortable including the possibility of microorganisms, to ascertain parentage of human or non-human individual, and to monitor responses to therapies including the possibility of and confication of human and non-human individuals, plants and confort in gene mapping and population studies. LASA may also be used in forensic crime, in gene mapping and population studies. LASA may also be used in crepeat regions such as a nucleotide length polymorphism in a eukaryotic genome. The LASA method avoids the time and cost required by prior art marticular virtular populative defentify and current diarmore is also be used in mathor mathorical and mucleotide length polymorphism is a eukaryotic genome. The LASA method avoids the time and cost required by prior art matricular virtular virtular sequence is an allocation such as an eucleotide length polymorphism in a eukaryotic genome. The LASA method avoids the time and cost required by prior art mathoricallar polymorphism and an enc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       particular, current diagnosis of Huntington's disease relies heavily upon the use of gel electrophoresis, a process that has proved difficult to automate or minitatirise. The LASA method allows total avoidance of this limiting step, making it a strong candidate for future use in clinical and laboratory procedures. ABK24216-ABK24313 represent primers used to
                                                          Detecting a nucleotide repeat region in a nucleic acid having a particular length, useful for identifying nucleotide length polymorphism associated with a neurodegenerative disease, comprises using a ligaseassisted spacer addition assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       detect polymorphisms or microsatellites as described in the method of

Weber JL;

```
The invention relates to the isolation of polymorphic repeat sequences markers. Primers based on these sequences can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AATGS79-166047. Those clones where the repeat sequence has been determined are shown in AATGS704-797. This repeat sequence is from the marker clone Mdf8 which contains the repeat sequence is from the marker clone Mdf8 which contains the repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.
                                                                                                                                                                                             Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                        ð
                                                                                                                                                                                                                               g
8X38888888888888
                                                                                                                                                                                                                                                                                                            ö
                                                                                The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Glones containing the animal or plant breeding or pedigree analysis. Glones containing the phage libraries were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(GC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T6647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf45 which contains the repeat sequence is from formula: (CA)20.5. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these

Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises mucleic acid primers specifically priming and allowing amplification of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dc-dA). (dg-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers ART65798-766047. Those clones where the repeat sequence has been determined are shown in ART65704-797. This repeat sequence is from the marker clone Mdf63 which contains the repeat sequence is from the marker clone Mdf63 which contains the repeat sequence having the formula: (CA)20.5. (Updated on 25-MAR-2003 to correct PF field.)

CC vbetaRNA or cDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases
CC including autoimmune diseases, degenerative nervous system diseases.
CC graft versus host disease, hypersensitivity diseases, infectious diseases
CC and neoplastic diseases. Autoimmune diseases include Addison's disease.
CC atrophic gastritis. Degenerative nervous system diseases include multiple
CC atrophic gastritis. Degenerative nervous system diseases include multiple
CC I hypersensitivities such as contact with allergens that lead to
CC allergies, Type II hypersensitivities such as those contact with allergens include Type
CC allergies, Type II hypersensitivities such as those caused by viruses such as HIV, fungal infections such as those caused by sepast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by such as leukaemias, lymphomas and cancers such as cancer of the brain, because the present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bow with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               - used in genetic identification, gene

required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective by receding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf62 which contains the repeat sequence is from formula: (AC)21. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence acid (I) from ryegrass or fescue species including a simple sequence or repeat (SSR), having 2 or more tandemly repeated nucleic dore elements 2.6 nucleotides in length. Also included are a nucleic acid primer or interpretation of fescue genomic DNA enriched for SSRs and fescue genomic DNA enriched for SSRs and fescue genomic DNA enriched for SSRs and fescue genomic DNA enriched for SSRs prepared by the MI, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely caspociated with the gene act and that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a preferentially co-inherited, and selecting for the SSR in the breeding, a cereal species variaties by assessing variation between SSR variation within seed batch of an SSR. The SSRs seed batches by assessing variation within seed batch of an SSR. The SSRs may be used in the selection of genes in grass or cereal breeding, for profiling grass or cereal species variation the purity of grass or cereal season or cereal section of genes in grass or cereal breeding, for profiling grass or cereal seed batches, and for DNA profiling to establish the distinct identity, uniformity and/or stability of a cultivar. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species

The invention relates to a method of identifying or detecting a mucleotide regeat region in a nucleic acid molecule characterised by a mucleotide regeat region in a nucleic acid molecule characterised by a comprising employing ligase-sasisted spacer addition classed assay. The method is useful in the identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a nucleotide length polymorphism in animals or humans, which is a sesciated with a neurodegenerative disease including fragile X syndrome, a useciated with a neurodegenerative disease including fragile X syndrome, be used for identifying and/or typing microorganisms including yeasts and cover uni- and multi-cellular organisms, as well as prokaryotic microorganisms; and for genocryping subjects including humans. The method can be used to provide markers for use in Moreover, the method can be used to provide markers for use in identification of human and non-human individuals, plants and identification of human and non-human individuals, plants and identification of human and non-human individuals, plants and microorganisms, to ascertain parentage of human or non-human individual, crime, in gene mapping and population studies including the possibility of science to identify a particular victim or an alleged perpetrator of a crime, in gene mapping and population studies lass may also be used in the manufacture of a kit for detecting and/or identifying nucleotide crime and complex mapping and population studies lass may also be used in the methods using gelelectrophoresis and Southern transfer analysis. In methods using gelelectrophoresis and Southern transfer analysis. In parented diagnosis of Huntington's disease relies heavily upon the use of gel electrophoresis, a process that has proved difficult to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting a nucleotide repeat region in a nucleic acid having a particular length, useful for identifying nucleotide length polymorphism associated with a neurodegenerative disease, comprises using a ligase-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone Mdf123 which contains the repeat sequence la from the marker clone Mdf123 which contains the repeat sequence having the formula: (AC)21.5. (Updated on 25-MAR-2003 to correct PF field.)
automate or miniaturise. The LASA method allows total avoidance of this limiting step, making it a strong candidate for future use in clinical and laboratory procedures. ABK24276-ABK24313 represent primers used to detect polymorphisms or microsatellites as described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detection of polymorphic genetic markers of the form (dC-dA) n (dG-dT) n - using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polymorphism; repeat sequence; genetic marker; primer; amplification;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Screening a library of bovine Molo DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 closes cross-hybridised. Assuming independent distribution of microsatellites and Mbo! sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for a. 230 such bovine microsatellites is summarised in the sequence information for an expecification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

In vitro amplied (using the program OPTIPRIM). The microsatellites may be used to identify individuals for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

Bos taurus.

AAQ33983;

```
The sequence is that of a bovine microsatellite sequence obtd. by

creening a library of bovine MboI DNA fragments of between 250 and 500

creening a library of bovine MboI DNA fragments of between 250 and 500

creening a cross-hybridised. Assuming independent distribution of

creening a genome is estimated at >100, 000. The sequence information

crossatellites and MboI sites, the frequency of (T6)n >9 microsatellites

crossatellites approach fries, the frequency of (T6)n >9 microsatellites

crossatellites and midexed herein (see below). The sequences upstream and

specification and indexed herein (see below). The sequences upstream and

crossatellite sequence ware used to generate the

crossatellite (using the program OPTIPRIM). The microsatellites may be

microsatellite (using the program OPTIPRIM). The microsatellites may be

credited to identify individuals, for parentage testing, and in the genetic

mapping of economic trait loci, or genes involved the determinism of

connecting. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine Mbol DNA fragments of between 250 and 500
screening a library of bovine Mbol DNA fragments of between 250 and 500
clones cross-bybridised. Assuming independent distribution of
microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100,000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
downstream of the microsatellite sequence water used to generate the
required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
microsatellite (using the program OPTIPRIM). The microsatellites may be
cused to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
connomically important traits epp. in cattle, to allow selective
breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

                                                                                                                                                                                                                             The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf66 which contains the repeat sequence is from formula: (AC)22. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                     Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n-using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus;

repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dc-dA). (dg-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf49 which contains the repeat sequence is from formula: (CA)22. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detecting a nucleotide repeat region in a nucleic acid having a particular length, useful for identifying nucleotide length polymorphism associated with a neurodegenerative disease, comprises using a ligase-

```
cc nucleotide repeat region in a nucleic acid molecule characterised by a particular length. In particular, the method is useful for identification of a nucleotide length polymorphism in animals or humans, which is associated with a neurodegenerative disease including fragile X syndrome, thurtington's disease, or muscular dystrophy. Furthermore, the method may thurtington's disease, or muscular dystrophy. Furthermore, the method may be used for identifing and/or typing microorganisms including yeasts and concern and multi-cellular organisms, as well as prokaryotic microorganisms, and for genotyping subjects including humans. The method is also useful for detecting certain cancers and other malignancies.

Cc microorganisms, to ascertain parentage of human or non-human individual, identification of human and non-human individuals, plants and microorganisms, to ascertain parentage of human or non-human individual, crime of and to monitor responses to therapies including the possibility of mucleic acid damage. The nucleotide polymorphisms may be used in forensic crime, in gene mapping and population studies. LASA may also be used in crime and population studies. LASA may also be used in the manufacture of a kit for detecting and/or identifying nucleotide crime to identify upon the use of gel electrophoresis and Southern transfer analysis. In methods using gel electrophoresis and Southern transfer analysis. In particular, current diagnosis, a process that has proved difficult to the use of gel electrophoresis, a process that has proved difficult to immiting step, making it a strong candidate for future use in clinical limiting step, making it a strong candidate for future use in clinical limiting step, making it a strong candidate for future use in clinical limitant candidate for future use in clinical limitant as a nuclear candidate for future use in clinical limitant controlled to miniaturise. Table 7; Page 295; 517pp; English.

```
The sequence is that of a bovine microsatellite sequence obtd. by

CC screening a library of bovine MboI DNA fragments of between 250 and 500

CC clones cross-hybridised. Assuming independent distribution of

CC clones cross-hybridised. Assuming independent distribution of

CC microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites

CC in the bovine genome is estimated at >100, 000. The sequence information

CC for ca. 230 such bovine microsatellites is summarised in the

CC general properation and indexed herein (see below). The sequences upstream and

CC downstream of the microsatellite sequence ware used to generate the

CC downstream of the microsatellite sequence ware used to generate the

Microsatellite (using the program OPTIPRIM). The microsatellites may be

microsatellity individuals, for parentage testing, and in the genetic

CC used to identify individuals, for parentage testing, and in the genetic

CC mapping of economic trait loci, or genes involved the determinism of

CC contract traits esp. in cattle, to allow selective

CC breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 210 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the
                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polymorphic bovine DNA markers - used in genetic identification, gene

required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

```

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (AC1)5 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information specification and indexed herein (see below). The sequence information of commistream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

The equired PCR primers for in vitro amplification of the corresp.

The increase little (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               bp with an (AC115 and a (TC1)5 oligonucleotide probe. One out of 50 closes cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (TG)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellites is summarised to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis of genetic disease, commercial animal or plant breeding or pedigree analysis of genetic disease, commercial phage libraries were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly (dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. Those close where the repeat sequence has been determined are shown in AATG5704-797. This repeat sequence has been determined are shown in AATG5704-797. This repeat sequence is from the marker close Mdf17 which contains the repeat sequence is from the marker close Mdf17 which contains the repeat sequence having the formula: (AC)23. (Updated on 25-MAR-2003 to correct PP field.)
                                                                                                                                                                                                                                                                                                                                                             Detection of polymorphic genetic markers of the form (dC-dA) n (dG-dT) n using novel nucleic acid mols. as primers.

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the animal or plant breeding or pedigree analysis. Clones containing the phage libraries which a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AMES798-f6647. Those clones where the repeat sequence has been determined are shown in AATGS704-797. This repeat sequence has been determined are shown in AATGS704-797. This repeat sequence is from the marker clone Mdf61 which contains the repeat sequence is from the marker clone Mdf61 which contains the repeat sequence having the formula: (CA)23. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dc-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Glones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66647. Those clones where the repeat sequence has been determined are shown in AAT65704.797. This repeat sequence is from
                                                                                                                                                                                                                                                       Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              the marker clone Mdf7 which contains the repeat sequence having the formula: (CA)20TA(CA)2. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 46 BP; 23 A; 22 C; 0 G; 1 T; 0 U; 0 Other;

The invention relates to a method of identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a particular length, comprising employing ligase-assisted spacer addition (LASA) assay. The method is useful in the identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a particular length. In particular, the method is useful for identification of a nucleotide length polymorphism in animals or humans, which is associated with a neurodegenerative disease including fragile X syndrome, Huntington's disease, or muscular dystrophy. Furthermore, the method may consist and for genotyping microorganisms including yeasts and lower uni- and multi-cellular organisms, as well as prokaryotic microorganisms; and for genotyping subjects including humans. The method can be used to provide markers for use in dentification of human and non-human individuals, plants and microorganisms, to ascertain parentage of human or non-human individual, and to response to therapies including the possibility of microorganisms, to ascertain parentage of human or non-human individual, and to cidentify a particular victim or an alleged perpetrator of a crime, in gene mapping and population studies. LASA may also be used in the manufacture of a kit for detecting and/or identifying nucleotide crepeat regions such as a nucleotide length polymorphism in a enkaryotic crepeat regions such as a nucleotide length polymorphism in a enkaryotic genome. The LASA method avoids the time and cost required at at Detecting a nucleotide repeat region in a nucleic acid having a particular length, useful for identifying nucleotide length polymorphism associated with a neurodegenerative disease, comprises using a ligase-Example 10; Page 55; 89pp; English. assisted spacer addition assay.

methods using gel electrophoresis and Southern transfer analysis. In particular, current diagnosis of Huntington's disease relies heavily upon the use of gel electrophoresis, a process that has proved difficult to automate or miniaturise. The LASA method allows total avoidance of this limiting step, making it a strong candidate for future use in clinical and laboratory procedures. ABK24276-ABK24313 represent primers used to

detect polymorphisms or microsatellites as described in the method of

invention

including autoimmune diseases, degenerative nervous system diseases, including autoimmune diseases, thereses, infectious diseases, graft versus host diseases, hypersensitivity diseases, infectious diseases and neoplastic diseases. Autoimmune diseases include Addison's disease, and neoplastic diseases. Autoimmune diseases include Addison's disease, arrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type clerosis and Alzheimer's disease. Hypersensitivity diseases include Type allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by Che yeast genus Candida, parasitic infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases include as cancer of the brain, such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or CDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2321 GTGTGTGTGTGTGTGTGTGTGTGTGTGCACATCCGCGTGTG 2365

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis of Genetic disease, commercial repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T6647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdflis which contains the repeat sequence is from the marker clone Mdflis which contains the repeat sequence by primer ATAGGAG(AC)17.5. The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T6647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf9 which contains the repeat sequence latiom formula: (CA)17G. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                     Detection of polymorphic genetic markers of the form (dC-dA) n (dG-dT) n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 35 BP; 17 A; 17 C; 1 G; 0 T; 0 U; 0 Other;

The sequence is that of a bovine microsatellite sequence obtd. by

Screening a library of bovine MboI DNA fragments of between 250 and 500

by with an (AC)15 and a (TC)15 oligonuclectide probe. One out of 50

clones cross-hybridised. Assuming independent distribution of

microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites

con the bovine genome is estimated at >100,000. The sequence information

for ca. 230 such bovine microsatellites is summarised in the

specification and indexed herein (see below). The sequences upstream and

constream of the microsatellite sequence waset to generate the

required PCR primers for in vitro amplification of the corresp.

microsatellite (using the program OPTIPRIM). The microsatellites may be

used to identify individuals, for parentage testing, and in the genetic

mapping of economic trait loci, or genes involved the determinism of

conomically important traits esp. in cattle, to allow selective

breding. See also AAQ33501-34437. (Updated on 25-WAR-2003 to correct PN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      which is part of a non-naturally occurring chromosome. Nucleic acids comprising the CYP3A4 polymorphic sequences can be used to screen gatients for altered metabolism for CYP3A4 substrates, potential drug-drug interactions, and adverse/side effects as well as diseases that result from environmental or occupational exposure to toxins. They can also be used to establish animal, cell culture and in vitro cell-free models for drug metabolism. Polymorphic CYP3A4 gene sequences can be used for expression studies to determine the effect of promoter and/or intron sequence variations on mRNA expression and stability. The polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a CYP3A4 sequence polymorphism of the invention,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CYP3A4 gene polymorphism; polymorphic locus; human; altered metabolism; CYP3A4 substrate; drug-drug interaction identification; toxin exposure; genetic linkage detection; phenotypic variation; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                               ó

The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
clones cross-hybridised. Assuming independent distribution of
microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100,00. The sequence information
cfor ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequence upstream and
downstream of the microsatellite sequence water used to generate the
required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
economically important traits esp. in cattle, to allow selective
breeding. See also AAQ33501-34437. (Updated on 25-WAR-2003 to correct PN
are also used as single nucleotide polymorphisms to detect genetic linkage to phenotypic variation in activity and expression of CYP3A4. The nucleic acids can also be used to generate genetically modified non-human animals or site specific gene modifications in cell lines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleocide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequence upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (AClis and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information for ca. 230 such bovine microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. The microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci or genes involved the determinism of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine Mbol DNA fragments of between 250 and 500
by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites
clones cross-hybridised. Assuming independent distribution of
microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites
con the bovine genome is estimated at >100, 000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
comparised of the microsatellite sequence were used to generate the
required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
confounded thy indoviduals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
economically important traits esp. in cattle, to allow selective
find.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
